# VVOTE 

## AUGUST 2016 <br> REPRESENTATIONAL BIAS IN THE 2014 ELECTORATE <br> by LASHONDA BRENSON, Ph.D.

Dear Colleagues:
Project Vote's mission has always been to increase voter participation among under-represented populations, and to ensure that the American electorate represents the American people.

Representational Bias, therefore, is perhaps the most important series of publications that we produce. It tells us-and the entire voting rights community-exactly where there is still significant work to be done to realize our shared vision of a fully representative democracy.

Using an approach first developed by Douglas R. Hess in 2007, Representational Bias analyzes Census Bureau data to identify who is registered to vote, and who really does vote, in American elections. By comparing rates across several election cycles, it identifies trends in registration and voter turnout according to race, ethnicity, income, age, gender, and a number of other demographic categories, in order to determine where the gaps in representation still exist.

With a presidential election just over three months away, we are pleased now to present Representational Bias in the 2014 Electorate, by Project Vote Research Director LaShonda Brenson. In this report, Dr. Brenson examines the population, registration, and voting rates in the 2014 election, which represented a historic low in voter turnout. By comparing these rates to both midterm and presidential elections since 2006, Dr. Brenson creates a comprehensive snapshot of current voting trends in the United States, and identifies where we need to focus our collective efforts to achieve true representation.

When our electorate does not accurately reflect the racial, ethnic, and economic diversity of the United States, democracy is not working the way it's supposed to work. Our national priorities are skewed, our most vulnerable citizens are left out of the process, and our government does not represent who we are as a people.

So we see Representational Bias in the 2014 Electorate as more than a research project. We see it as a report card on our democratic process, and a pressing agenda for the hard work still ahead.

Regards,

Michael Slater
President
Project Vote

## I. INTRODUCTION

Representational Bias in the 2014 Electorate details the demographics of the American electorate since the 2004 presidential election. Using the Census Bureau's Voting and Registration Supplement of the Current Population Survey (CPS), this report illustrates how political participation varies for different fragments of the voting eligible population (VEP) across both presidential and midterm elections.

The CPS is performed every two years on approximately 56,000 households, which are selected with the purpose of being representative of the U.S. population. The Census interviews individuals who are U.S. citizens and over 18 years of age on matters regarding voting and registration.

Using descriptive and summary statistics, this report highlights demographic characteristics and trends in the composition of the American electorate.

## Turnout in Midterm Elections

While conventional wisdom suggests that midterm elections generally have lower turnout rates when compared to presidential elections, the 2014 midterm election marked a historic low with a national turnout rate reported by some sources to be as low as 37 percent.' In fact, the 2014 midterm turnout was the lowest turnout in a midterm election since 1942, when the turnout rate was under 34 percent. ${ }^{2}$

More than 80 percent of U.S. states had turnout rates less than 50 percent in 2014, and the highest turnout rate was only 61 percent. Some states with competitive gubernatorial and Senate elections observed higher turnout rates, but not all: Georgia and North Carolina, for example, had competitive midterm elections, but only had slightly better turnout rates than states without such elections.

This suggests that there are other factors at play that explain the poor turnout rate in the 2014 midterm elections. For example, Colorado made substantial improvements to their voting practices, and had the highest turnout rate in the U.S. While Colorado did have a competitive Senate election, other states with equally competitive races did not fare as well. ${ }^{3}$ Therefore, the high turnout rate in Colorado (and some other states) supports the conclusion that increasing access to voter registration and voting (e.g. Election Day registration and early voting) may lead to higher turnout rates.

Similar to our previous findings from earlier Representational Bias reports, we find that low political participation was most dire among younger citizens, racial and ethnic minorities, low-income households, and those with less than a high-school education. We find that these disparities in political participation are more acute during midterm elections, relative to previous reports that examined participation in presidential elections.

Table I and Figure I summarize registration and voting rates for adult citizens in the 2014 midterm election by race, ethnicity, age, income, educational attainment, marital status, disability status, and residential mobility. Table 2 shows data on how many additional voters might result if marginalized populations voted at higher rates.

Disparities in political participation have existed in the polity for quite some time, and will not be redressed until action is taken on several fronts. Federal laws like the National Voter Registration Act of 1993 (NVRA), for example, were passed to expand opportunities for citizens to register to vote by offering registration through Department of Motor Vehicles (DMVs) and public assistance agencies. However, poor implementation and enforcement of the NVRA across the country has reduced the intended impact of the NVRA, and hindered the more representative electorate the law was designed to achieve.

In addition to enforcing the NVRA, state and local election officials should work to increase opportunities for disadvantage populations to register to vote. As shown in Table 3, when compared to whites, non-whites are more than three times as likely to register to vote at a public assistance agency office, and almost twice as likely to register through a voter registration drive. Racial and ethnic minorities are also more likely to register through the mail and at a school, hospital, or campus. Hence, it is incumbent upon state and local officials to enforce the NVRA and support efforts of civic organizations that seek to register under-represented groups in the polity.

This report examines how registration and turnout rates varied in the 2014 midterm election relative to the 2006 and 2010 midterm elections, and also considers how participation varied in the last several presidential elections.

## 2. CONTINUING DISPARITIES IN THE REGISTERED AND VOTING POPULATIONS

Although the non-white population is increasing, whites are still over-represented in the electorate. In 2014,69.9 percent of voters identified as white, compared to 12 percent black, I I . 4 percent Latino, and 4.4 percent Asian (see Table I). In regards to voter turnout, however, whites represented 76 percent of the electorate, and all of the non-white populations were under-represented in voting. Latinos - who make up II.4 percent of the population but only 7.3 percent of the electorate - were the most un-der-represented population.

Table I shows additional disparities in voter turnout:

- Young people ( 18 to 29 years of age) are significantly under-represented in the electorate, as they make up over 20 percent of the population, but only 10 percent of voters.
- Individuals with higher income and educational attainment are significantly more likely to vote than persons with less education and income.
- While there are more married adult citizens than unmarried adult citizens (by 5 percent), married people are significantly more likely to vote.
- Residential mobility is another important factor in predicting voter turnout, as persons living at the same address for 5 years or more represent 61 percent of adult citizens, but over 71 percent of voters.

Table 2 shows disparities in voter turnout amongst groups. This table also shows how many more voters an under-represented group would gain if parity existed between the various groups.

- If the non-white population voted at the same rate as whites, the electorate would grow by over 8.3 million voters.
- If individuals under the age of 30 voted at the same rate as persons aged 30 or older, the electorate would expand by nearly 13 million voters.
- If people from low-income households voted at the same rate as those earning more than $\$ 100,000$ a year, the electorate would grow by 9.7 million voters.
- If adult citizens with a High School education or less voted at the same rate as those with some college experience or more, there would be an additional $I 5.5$ million voters.

Figure I shows how all of these same groups-whites, persons over 30, and individuals with higher levels of income and education-are over-represented in the population of adult citizens who are not registered to vote.

The under-representation that we observe in voter registration and voter turnout is troubling. Not only do these disparities have the potential to elect persons not representative of the population, but they also sway how current policies are enforced and whether new public policies are introduced that might address disparities.

Table I: Composition of the American Electorate, 2014

|  | Demographic Category | Adult <br> Citizens | Voters |
| :---: | :---: | :---: | :---: |
| RACE | White | 69.9\% | 76.3\% |
|  | Black | 12.1\% | I 1.7\% |
|  | Asian/Pacific Islander | 4.5\% | 2.9\% |
|  | Latino | I 1.4\% | 7.3\% |
|  | Native American | 0.8\% | 0.6\% |
|  | Two or More Races | I.3\% | 1.2\% |
| AGE GROUP | Under 30 | 21.1\% | 10.0\% |
|  | 30- to 64-years-old | 58.8\% | 61.6\% |
|  | 65-years-old and older | 20.1\% | 28.4\% |
| ANNUAL HOUSEHOLD INCOME | Less than \$25,000 | 20.8\% | 14.9\% |
|  | \$25000 to \$50,000 | 25.1\% | 23.0\% |
|  | \$50,000 to \$75,000 | 18.9\% | 20.0\% |
|  | \$75,000 to \$100,000 | 12.2\% | 14.0\% |
|  | More than \$100,000 | 23.0\% | 28.2\% |
| EDUCATION | Less than High School Graduate | 9.6\% | 5.1\% |
|  | High School Graduate | 29.8\% | 24.1\% |
|  | Some College Experience | 30.0\% | 29.8\% |
|  | Bachelor's Degree or Higher | 30.5\% | 41.0\% |
| MARITAL STATUS | Married | 52.7\% | 63.5\% |
|  | Not Married | 47.3\% | 36.5\% |
| DISABILITY | Disability Reported | 12.9\% | 12.6\% |
|  | No Disability Reported | 87.1\% | 87.4\% |
| TIME AT PRESENT RESIDENCE | Less than I Year | 13.4\% | 7.0\% |
|  | I to 5 Years | 26.0\% | 21.3\% |
|  | 5 Years or More | 60.6\% | 71.8\% |

Table 2:Additional Voters Had Parity in Turnout Been Achieved, 2014

| Demographic Category | Comparison Groups | Voted as \% <br> of Adult <br> Citizens | Additional <br> Voters with <br> Turnout Parity <br> (in 1000s) |
| :--- | :--- | ---: | ---: |
| RACE | White | $45.77 \%$ |  |

|  |  |  |  |
| :--- | :--- | :--- | :--- |
| ANNUAL | $\$ 100,000$ or more | $51.32 \%$ |  |
|  | $\$ 25,000$ or less | $29.93 \%$ | 9,794 |
| INCOME |  |  |  |

EDUCATION

| Some College or more | $49.03 \%$ |  |
| :--- | :--- | :--- |
| High School or Less | $31.07 \%$ | $\mathbf{1 5 , 5 8 7}$ |

| Not Married | $32.37 \%$ |  |  |

DISABILITY

| Disability Reported | $40.85 \%$ |  |
| :--- | :--- | :--- |
| No Disability Reported | $42.10 \%$ | $\mathbf{2 , 3 9 4}$ |

Figure I: Demographic Groups as a Percentage of the Adult Citizen Population, and as a Percentage of the Unregistered Population, 2014

## 3. METHODS OF REGISTERING TOVOTE

Table 3 presents data on how race and ethnicity intersected with voter registration in 2014. It shows that DMVs registered similar proportions of non-white and white voters, but other locations, such as public assistance agencies, registered non-white citizens at higher rates than white registrants.

Offering voter registration at public assistance offices, as the NVRA requires, increases access to voting to citizens who are qualified to vote, but who may not interact with other institutions (like DMVs) that offer voter registration. In addition, political science research demonstrates that how a citizen interacts with public assistance programs can have lasting impacts about their belief in the responsiveness of government, political efficacy, and likelihood to engage in political events. ${ }^{4}$ Therefore, if voter registration is offered in public assistance offices in a meaningful way, not only are we registering members of un-der-represented populations who might not otherwise register to vote, but we are also, in some small way, demonstrating that their government cares if they register to vote and participate in elections. ${ }^{5}$

Table 3: How Citizens Reported Registering to Vote in 2014

| Registration Method | Whites (in 1000s) |  | Non-Whites (in 1000s) |  | Total (in 1000 s ) |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Department of Motor Vehicles | 11,177 | 27.73\% | 3,301 | 28.94\% | 14,488 | 28.00\% |
| Public Assistance Agency | 321 | 0.80\% | 341 | 2.99\% | 662 | 1.28\% |
| Registered by mail | 5,315 | 13.19\% | 2,139 | 18.75\% | 7,454 | 14.41\% |
| Registered using the Internet or online | 1,123 | 2.79\% | 341 | 2.99\% | 1,464 | 2.83\% |
| School, hospital, or on campus | 2,177 | 5.40\% | 953 | 8.35\% | 3,130 | 6.05\% |
| Registration drive | 1,639 | 4.07\% | 883 | 7.74\% | 2,522 | 4.88\% |
| Polling place on election or primary day | 4,364 | 10.83\% | 815 | 7.14\% | 5,179 | 10.01\% |
| Other | 2,078 | 5.16\% | 595 | 5.22\% | 2,673 | 5.17\% |
| Total | 40,306 | 100.00\% | 1 1,408 | 100.00\% | 51,714 | 100.00\% |

## 4. NATIONALAND STATE REGISTRATION ANDVOTING DATA

Table 4 shows statistics on state-level reported registration and voting rates for the 2014 midterm election. Each state is ranked by its registration and voting turnout rates with "I" indicating the highest registration and voting turnout rates. Maine, Mississippi, the District of Columbia, Maryland, and Missouri have the five highest voter registration rates. Colorado, Hawaii, Maine, Oregon, and Alaska are the states with the five highest voter turnout rates in the recent midterm election.

Many states that have relatively high voter registration and turnout rates have a few things in common: competitive elections with large amounts of money spent on campaigning; and populations that are have high levels of educational attainment, which is correlated with higher turnout rates. In addition, many of these states have policies that make the process of registering and voting easy (e.g. Maine allows citizens to register to vote on Election Day.)

Figures 2 and $\mathbf{3}$ show states ranked by voter registration and voter turnout rates, respectively, for the 2014 midterm election.

As discussed above, presidential elections typically have higher levels of participation than midterm elections. Because of this, when studying electoral participation over time, it is most useful to compare data that results from similar elections. Table $\mathbf{5}$ and Table $\mathbf{6}$ present the number of citizens who voted as a percent of those registered in the last three midterm elections and last three presidential elections, respectively. We observed that all six elections have overall registrations rates around an average of 70 percent, with presidential elections having registration rates slightly above 70 percent, and while registration rates in midterm elections are slightly below 70 percent.

Tables 7 and 8 show the total number of citizens that reported voting in the last three midterm and presidential elections. Unlike registration rates, we observed greater differences in the rate of persons that voted as a percent of those registered. That is, during presidential elections, we observe that overall rates of voter turnout as a percentage of those registered averaged around 90 percent. However, these rates were around 70 percent during the 2006 and 2010 midterm elections, and fell to 65 percent in the 2014 midterm election.

Table 4:Adult Citizen Population, Registration, and Voting by State, 2014

| State | Adult Citizens (in 1000s) | Registered (in 1000s) | Registered as \% of Adult Citizens | Rank | $\begin{aligned} & \text { Voted } \\ & \text { (in } 1000 \mathrm{~s} \text { ) } \end{aligned}$ | Voted as \% of Adult Citizens | Rank | $\begin{array}{r} \text { Voted } \\ \text { as \% of } \\ \text { Registered } \end{array}$ |

## V. RACEAND ETHNICITY

Tables 9 and 10 present registration and voting rates by race and ethnicity for the elections of 2004, $2006,2008,2010,2012$, and 2014. The data show that the non-white population is growing over time; 9.I million more individuals identified as non-white in 2014 since the last midterm election in 2010.

While voter registration turnout rates among each racial and ethnic group in the 2010 midterm election persisted in 2014, voter turnout decreased for each group. Looking at the second to last column of Table 10 for the 2010 and 2014 elections, we observe that voter turnout for whites and blacks decreased by 3 percentage points, but decreased by 4 percentage points for Asian voters, 5 percentage points for both Latino and multi-racial voters, and 7 percentage points for Native voters.

Figures 4 through 7 illustrate the trend in registration and voting rates by race and ethnicity from 2004 to 2014. Again, we have separated midterm and presidential elections in order to make accurate comparisons, and we observe lower turnout rates amongst all racial and ethnic groups in midterm elections.

- Registration rates in the 2006,2010, and 2014 midterm elections have remained roughly the same rate for each racial and ethnic group.
- Voting turnout rates in the 2006, 2010, and 2014 midterm elections, however, varied for each racial and ethnic group. Some groups observed higher turnout rates in 2006, and others in 2010 , but all groups observed lower turnout rates in the 2014 midterm election.

Figures 4 and $\mathbf{5}$ show that voter registration rates in presidential elections are 5 to 7 percentage points higher than rates in midterm elections. However, Figures 6 and 7 demonstrate that turnout is significantly higher in presidential elections relative to midterm elections, by anywhere from 13 to 26 percentage points.

- For example, the overall turnout between the 2012 presidential election and the 2014 midterm varied by over twenty percentage points. This is why one should use caution when comparing and contrasting registration and turnout rates in presidential and midterm elections.

## 6. GENDER AND MARITAL STATUS

Gender and marital status are important variables in predicting voter registration and turnout. Women typically register and vote in elections at higher rates than men. Being married increases the likelihood that an individual will register and vote. Marital status is particularly important among men, as unmarried women register and vote at higher rates than unmarried men.

Tables II and I2 show registration and voting rates for the adult citizen population by gender from 2004 to 2014:

- Table II shows that 71 percent of men and 74 percent of women were registered in 2004, but dropped 2 percentage points for men and only I percentage point for women in 2008. Registration rates remained the same for each group in 2012 .
- Table I2 illustrates that men and women were much less likely to say they were registered in 2014 than in 2010 and 2006.
- Table II shows that self-reported voting among men and women remained consistent from 2004 to 2008 , but dropped by 2 percentage points for each group in 2012 .
- Table 12 demonstrates that self-reported voting among men decreased slightly from 2006 to 2010 , but increased back to 47 percent in 2014 . Self-reported voting among women decreased by three percentage points from 2006 to 20 I 0, but voting among women increased by seven percentage points in 2014.

Tables I3 and I4 compare voting and registration rates among men and women by marital status from 2004 to 2014:

- Tables I3 and I4 show that, in presidential and midterm elections, married women are more likely to register and vote than married men and unmarried men and women.
- Table $\mathbf{I 3}$ shows that self-reported registration and turnout rates among each group remained relatively consistent during presidential elections.
- Table $\mathbf{I 4}$ demonstrates that registration rates among each group remained steady during midterm elections, but voting rates change substantial. In the case of married women and men, voting rates increased by 12 (men) and 14 (women) percentage points from 2006 to 2010 , but decreased by 17 and 20 percentage points, respectively in 2014 .

Figure 9 shows the breakdown of the married and unmarried populations as a percentage of adult citizens, the registered, and voters.

Figure 9: Composition of the Adult Citizen, Registered, and Voting Populations by Gender and and Marital Status, 2014

## 7. AGE AND GENDER

Previous research posits that older Americans of all racial and ethnic groups tend to register to vote and participate in elections at higher rates than younger individuals in their same racial or ethnic group.

This report treats age as a categorical variable and breaks individuals into three groups: I8 to 29 years old (representing young adults), 30 to 64 years old (middle-age adults), and 65 years old and over (senior adults).

Tables 15 and 16 show registration and voting rates for the adult citizen population by age and gender from 2004 to 2014:

- Tables 15 and 16 show that, in presidential and midterm elections, men 65 and over are more likely to register and vote than other men and women of any other age group.
- Registration and voting turnout rates increased from 2004 to 2008, but this trend did not persist through the 2012 election.
- Self-reported registration and voting turnout rates were especially low among young adults in the 2006, 2010, and 2014 midterm elections, as middle-age and older adults reported thirty to forty percent higher rates of registration and voting than young adults.

Figure 10 shows the breakdown of the adult citizen, registered, and voter populations in 2014 by age group.

Figure I0: Composition of the Adult Citizen, Registered, and Voting Populations by Age Group, 2014

## 8. GENDER,AGE,AND RACE

Tables 17 and 18 illustrate how the relationship between age, gender, and electoral participation is moderated by race and ethnicity. Similar to results in the previous section, we find that older adults and women of all racial and ethnic groups tend to register and vote at higher rates than younger adults and men of the same race or ethnicity.

Table $\mathbf{1 7}$ reports the registration rates among men and women by race, ethnicity, and gender in 2014:

- Self-reported registration rates were highest among white women, black women, and multi-racial women; rates of registration were especially high among group members 65 and over.
- We also observe that registration rates among men of each racial and ethnic group are highest among older individuals.

Table 18 shows reported voting rates for men and women by race, ethnicity and gender in 2014:

- In regards to voting, we observe that, for each racial or ethnic group as a whole, voting as a percentage of the adult citizen population is below fifty percent. However, considering voters as a proportion of those registered, black and white voters of both genders have the highest proportion of voters relative to other groups.
- White men had a slightly higher voter turnout rate (by I percent) than white women overall, but senior white men outvoted senior white women by 6 percent. Amongst black voters, senior black voters of both gender voted at the same rate, but black, female, middle-aged and young voters reported higher voter turnout than black males in the same age groups.

Figure II shows a comparison of turnout rates by gender and race and ethnicity for the 2010 and 2014 elections.

Figure $\mathbf{I} \mathbf{2}$ shows a comparison of turnout rates by gender, age, and race and ethnicity for the 2012 and 2014 elections. We observe significant differences between all groups, with some groups (Black men under 30) having as much as a 39 percent difference in turnout in just two years. These differences say more about the differences between presidential and midterm elections, and less about the difference in turnout within a particular group in two years.

Figure II: Turnout by Gender, Age, and Race, 2010 \& 2014

Figure I2: Turnout by Gender, Age, and Race, 2012 \& 2014

## 9. INCOME AND EDUCATION

Higher levels of income and educational attainment are understood to be positively associated with higher rates of registration and turnout. ${ }^{6}$ There are several reasons why this may be the case.

First, registering and turning out to vote costs time, and it requires knowledge about the electoral process. A higher income reduces some of the costs associated with registering and voting, because these individuals are more likely to be able to take time away for work to register and vote than individuals with lower incomes. In addition, regardless of their level of educational attainment, individuals with higher levels of income are more likely to acquire jobs and interests that lead to higher levels of voting and political participation.? Lastly, individuals with high levels of income and educational attainment are more likely to be targets of campaign mobilization and, in general, see their interests represented in politics, when compared to individuals with lower levels of income and educational attainment. ${ }^{8}$

To explore the relationship between income, educational attainment, and electoral participation, this report treats income as a categorical variable broken into five groups, ranging from household incomes of less than $\$ 25,000$ to $\$ 100,000$ or more. Similarly, educational attainment is treated as a categorical variable that breaks individuals into four groups: those with less than a high school diploma, high school graduates, those with some college or an associate's degree, and individuals with a bachelor's degree or higher.

Table 19 shows self-reported registration and voting rates by income in 2014:

- As expected, individuals with higher incomes reported higher levels of registration and voting than individuals with lower incomes.
- For example, of people earning less than $\$ 25,000$, only 30 percent reported voting in the 2014 election, compared to 5 I percent of those earning over $\$ 100,000$ dollars.

Table 20 and 21 present reported registration and voting rates by educational attainment level for the years 2004 to 2014:

- Table $2 \mathbf{I}$ shows that registration rates remained relatively consistent across each education level from 2010 to 2014, but turnout rates decreased 5 to 6 percentage points for each group.
- Regardless of registration and turnout trends, individuals with Bachelor's degrees or higher reported significantly higher levels of registration and voting.

Table 19: Adult Citizen Population, Registration, and Voting by Annual Household Income, 2014

Figure I4: Composition of the Adult Citizen, Registered, and Voting Populations by Education, 2012

## I0. RESIDENTIAL MOBILITY

Another important variable in predicting who registers and turns out to vote is residential mobility.Voter registration is connected to an individual's home address, so the more someone moves, the less likely they are register or stay registered. Upon moving, individuals are required to update their registrations and become informed about registration and voting in the new location. This is information that not every voter has access to, as voters may move to different counties in the same state and assume that their registration is still valid. As we will see in Table 23, racial and ethnic minorities are generally less likely to remain at the same address than whites.

Table 22 shows reported registration and voting rates by length of time at a current address:

- Table 22 demonstrates that individuals are significantly more likely to register and vote when they have lived at a residence for five years or more. There is a 27 percent difference in reported registration rates between people who lived in a residence for one year or less and those residing in a set location for five years or more.
- Similarly, persons who reside at a residence for five years or more reported higher levels of voting than individuals with less stable addresses.

Table 23 explores how race and ethnicity moderates registration and voting rates by length of time at a current address:

- As expected, it demonstrates that racial and ethnic minorities are likely to move residences more frequently than whites. Only 12 percent of whites reported living at their current address for less than one year in 2014, compared to 16 percent for both black and Latino respondents.

Table 24 shows that the racial and ethnic minority groups are younger overall, more mobile, and less likely to have achieved higher educational attainment levels, than whites. All of these factors affect their rates of registration and turnout.

Table 22: Adult Citizen Population, Registration, and Voting by Residency Length, 2014

| Length of Time at Cuurent Address | Adult Citizens (in 1000s) | $\begin{gathered} \text { Column } \\ \% \end{gathered}$ | Registered (in 1000s) | Registered as \% of Adult Citizens | Voted (in 1000s) | Voted as \% of Adult Citizens | Voted as \% of Registered |

| Multi-racial | $25 \%$ | $17 \%$ | $35 \%$ |

## II. DISABILITY

Americans with disabilities are under-represented in the electorate. Table $\mathbf{2 5}$ shows reported registration and voting in accordance to disability status.

- Table 25 shows that individuals, regardless of their ability status, reported the same level of voter registration rates.
- However, voting is slightly higher among persons reporting no disability: turnout was 65 percent for individuals reporting no disability, compared to 63 percent for those reporting a disability.

Table 25: Disability Status and Voting Behavior, 2014

| Disability Status | Adult <br> Citizens | Column <br> $\%$ | Registered | Registered <br> as \% of <br> Adult <br> Citizens | Voted | Voted as <br> $\%$ of Adult <br> Citizens | Voted <br> as \% of <br> Registered |

| No Disability | 191,485 | $87 \%$ | 123,794 | $65 \%$ | 80,628 | $42 \%$ | $65 \%$ |
| Total | 219,941 | $100 \%$ | 142,166 | $65 \%$ | 92,251 | $42 \%$ | $65 \%$ |

## I2. CONCLUSION

Using survey data from the Census Bureau's Current Population Survey, this report has demonstrated differences in the political participation of several groups in the 2014 midterm election. As mentioned at the beginning of this report, the 2014 midterm election marked a historic low in electoral participation.

Withstanding the historic low turnout in the recent election, low-income households, young adults (I8 to 29 years old), less educated individuals, and persons with higher residential mobility rates, all remain under-represented in the electorate. And non-whites are over-represented in these groups with low registration and turnout rates.

Table 24 presents the percentage of adult citizens from each racial or ethnic group in the three categories strongly associated with low political participation rates: low educational attainment, youth, and residential mobility. According to this table, non-whites are overwhelmingly over-represented in groups with low electoral participation in 2014.

It is worth noting that blacks and Latinos consistently rank among the highest in the categories that correlate with low participation. Yet, blacks are registering and voting in proportion to their numbers in the general population. The same is not yet true for the Latino electorate. Partly due to the expansion of the Latino population and new voter laws, registration and turnout rates dropped for this group in 2014. According to a recent report by the NALEO Educational Fund, 19 states enacted laws since November 2012 that make it more difficult for Latinos and other groups to vote. ${ }^{9}$ This report estimates that theses laws inhibit more than 875,000 eligible Latino voters from voting in the upcoming election.

As we approach the 2016 presidential election, under-representation in the electorate is more concerning than ever. As mentioned earlier, under-representation in the polity not only skews who we elect, but it also allows for legislators to introduce and pass policies that may not be representative of needs and priorities of the American public. As a result, public policy may disproportionately reflect the interests of only those who show up at the polls-those who are white, older, educated, and wealthy.

In order for policies to successfully reflect the interests of all Americans, it is necessary to address the limitations to full representation discussed here. To accomplish this, it is crucial to push forward efforts that facilitate registration and voting for all Americans by ensuring the enforcement of the NVRA and supporting laws that make voting easier.

1. See Brian Miller. American Goes to the Polls 2014:A Report on Voter Turnout in the 2014 Midterm Election (Nonprofit VOTE, 2014). We should note that the turnout rate we found in our report was 42 percent. It is likely that our turnout rate is slightly higher than other related reports because our data is based on self-reported rates of turnout. Participants in the CPS may have reported that they turned out to vote when they did not because of social desirability-the tendency of survey respondents to answer questions in a way that is seen as satisfactory.
2. Jose DeIReal, "Voter turnout in 2014 was the lowest since WWII," Washington Post, November I0, 2014. Available at https://www.washingtonpost.com/news/post-politics/wp/20|4/II/I0/voter-turnout-in-20|4-was-the-lowest-since-wwii/
3. Colorado and three other states used same-day registration for the first time in the recent midterm election. Colorado also began using mail voting in the recent election. Mail voting requires election officials in Colorado to mail ballots to every registered voter in the state two weeks before Election Day. According to a study conducted by The Pew Charitable Trusts, the changes that Colorado made to the voting process saved money, as the cost-pervote decreased by 40 percent, and 90 percent of surveyed voters reported feeling satisfied or very satisfied with the new changes to Colorado's voting process. (For more details about this report, see "Colorado Voting Reforms: Early Results," (Pew Charitable Trust, March 2016), available at http://www.pewtrusts.org/~/media/assets/2016/03/ coloradovotingreformsearlyresults.pdf).

6. Several studies have explored the relationship between education, income, and voting. On the one hand, some researchers conclude that educational attainment is said to be the demographic variable most strongly to voting (e.g. Campbell, Converse, Miller, and Stokes. 1960. The American Voter. New York: John Wiley \& Sons, Inc.). One the other, some studies conclude that educational attainment has had no consistent impact on voting (e.g. Sideny Verba, Norman H. Nie, and Jae-On Kim. Participation and Political Equality: A Seven-Nation Study (New York: Cambridge University Press, 1978), and is less important than income.

# About the Author 

LaShonda Brenson is Research Director for Project Vote. Dr. Brenson has a Ph.D. in Political Science from University of Michigan-Ann Arbor and a B.A. in Mathematics and Political Science from the University of Rochester.

## About Project Vote

Project Vote is a national nonpartisan, non-profit organization that promotes voting in historically under-represented communities. Project Vote takes a leadership role in nationwide voting rights and election administration issues, working through research, litigation, and advocacy to ensure that our constituencies can register, vote, and cast ballots that count.
